Day-3

1. Objects, Fields and Records in Salesforce.

Object = Table {Collection of similar records}
Field = column
Record = Rows.

Object:-

- Account,
- Contact
- Lead
- Oppurtunity
- Case.

} Manually.

→ Custom objects. Created by Users : Student object.

Field:-

column in an object.

(i) Text Field.
(ii) Number
(iii) Date

2. App vs Object vs Tab.

App:- Collection of Related Tabs or objects.
Object:- Table stores data.
Tab:- It is an User Interface used to access an object. without tab users cannot easily open the object.

* Standard vs Custom objects.

• provided by Salesforce.	• created by organization
• Account	• Library
• Contact	• Hostel.
• Lead	• Exams.

3. Lookup Relationship:-

→ Connection b/w one object to another.

→ It creates link between Records.

• junction objects:-

used for many-to many Relationships.

4. Formula Fields vs Validation objects

Formula Field:-

It is used calculate or display a value Automatically.

Validation Rule:-

→ It is used to prevent users from saving invalid data.

→ It checks the condition before saving the record.

→ If the condition true → salesforce throws an error.

4. Formula Fields:-

Formula Fields automatically calculates values using other Fields.

It helps:

- Reduce Manual work
- Avoid Calculation mistakes
- Save time.

ex:- First Name + " " + Last Name.

- Automatically combines both names.

ex:- $\frac{\text{Obtained Marks}}{\text{Total Marks}} \times 100$.

Calculate student percentage automatically

5. Validation Rules:-

- email cannot be empty
- Negative Salary
- Age Cannot be Negative.
- Seats Cannot exceed limit.

6. Reflection:-

Instead of random spreadsheets.

- Manage large amount of Information
- Remove Duplicates
- Improve Reporting.
